Privacy & data

8D Navigator 1.0.1 – what it keeps, where, and what leaves your computer: nothing.

Nothing leaves your computer

8D Navigator never connects to the internet: no account, no cloud, no updates, no usage statistics. Speech-to-text runs on your computer with a model that ships inside the program. The program contains no internet libraries, and an extra lock inside it refuses any connection attempt.

What it stores, and where

Your answers, your voice recordings, and the Word/PDF files you create – all in one folder: Documents\8D Navigator Drafts (or C:\8D Navigator Drafts if you moved it). The app's own data is in the subfolder “_my answers”. One small file in AppData\Local\8D Navigator remembers where that folder is.

Cloud folders – your choice

If Windows syncs your Documents folder to OneDrive (or you keep the folder in Dropbox or Google Drive), the files would be copied online by that service – not by 8D Navigator. The app tells you when this is the case and moves the folder to this computer with one click.

Dictation

Use the Record button. Windows' own dictation (Windows key + H) may send your voice to Microsoft's online speech service.

Protecting the files

The files are not encrypted by the app. They are protected by your Windows password; for full-disk encryption switch on BitLocker or Device Encryption (Settings → Privacy & security → Device encryption, if your Windows offers it). Backups can be protected with a password (AES-256) – write the password down: without it nobody, not even you, can open the backup.

You decide what goes out

Only you send a file: by uploading it to your website or by email. Deleting the folder deletes everything.

How to check it yourself

While the app runs, open Resource Monitor (resmon) → Network: “8D Navigator.exe” shows no network activity. Or switch off Wi-Fi: everything still works the same way.
